Automatic filter AF 172 G

with external pressure cleaning and integrated cyclone effect Connection sizes: DN 40/G1 1/2, cast design

1. Short description

Filtration Group automatic backflush filters are suitable for applications where low-viscosity liquids have to be filtered.

These compact, inline filter systems are designed for automatic cleaning. The system is cleaned by rotating the element and backflushing with external or internal pressure media.

Advantages:

- Low lifecycle costs because no filter material is consumed
- Cleaning without interrupting filtration
- Precise separation quality in accordance with the surface filter principle
- Top-quality, asymmetric filter medium made of multiple-sintered stainless steel fleece on a rugged core element
- Efficient filter cleaning assures maximum process stability
- Solid construction and high-quality materials for a long service life
- Minimal liquid loss during cleaning
- Filter cleaned one segment at a time with a high backflush pulse
- Actual filter rating and nominal separation are indicated
- Integrated preseparation thanks to tangential inflow and preseparator tube
- Material variants open up a wide range of applications
- Modular Filtration Group Vario system for optimum filter selection
- Application in Ex zone 1 and 2 optional
- Easy maintenance
- Worldwide distribution

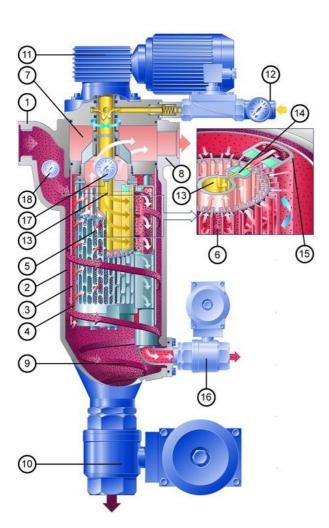

2. Operating principle

The Filtration Group AF 172 G backflush filter belongs to the Vario series. The compact Filtration Group automatic filter system is used for fine and micro-filtration of a variety of low-viscosity liquids.

This inline pressure filter consumes no filter material, which means there is also no need for subsequent disposal. The filter is cleaned without interrupting operation. The concentrated solids are drained off simply by opening the system for a short time.

The medium to be cleaned is guided into the filter housing under pressure and flows inward through the Filtration Group segmented element. Particles settle on the surface of the filter medium. The filtered fluid exits the filter housing at the top opposite the inlet connection.

The integrated preseperator relieves the load on the segmented element, particularly from coarse and heavy particles. This is achieved by a tangential flow around the preseparator tube and the deflection edges.

The filter is cleaned when a preset differential pressure limit, a set interval or a defined filtered fluid quantity is reached.

The segmented element is turned as the cleaning and external pressure valves are opened. The segments are then guided one at a time past the pressure channel housing on the inside and the flushing channel on the outside, causing them to open and close alternately. The integrated external pressure accumulator is pretensioned during closing, so that when one segment opens, an outward surge cleans the separated particles from the filter material. As a result of this pulse cleaning principle, the particles are catapulted out, collected in the flushing channel and discharged almost entirely with external medium. One turn suffices to clean all segments.

The residue that has settled in the collection cone can be emptied via the drain valve either when the machine is at a stillstand or during filtration

All filters of the Filtration Group Vario series are protected by various patents.

Used Filtration Group filter elements in the AF 172 G backflush filter:

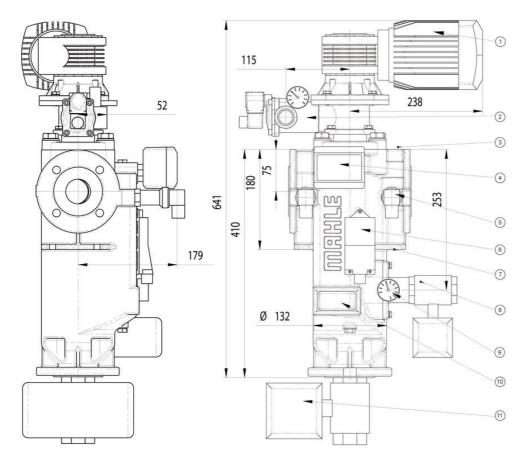

Filtration Group topmesh elements (stand-

ard):

- Good cleanability due to asymmetric design
- Large effective filter surface
- Defined particle retention
- Several material combinations possible
 - 1 Inlet connection
 - 2 Outer inlet plenum
 - 3 Preseparator tube
 - 4 Inner inlet plenum
 - 5 Filtration Group segmented element
- 6 Filtration Group filter material
- 7 Plenum for filtered fluid
- 8 Outlet connection for filtered fluid
- 9 Residue collection cone
- 10 Drain valve
- 11 Drive motor
- 12 External pressure connection, external pressure and backflush valves and gauge P_f
- 13 External pressure accumulator
- 14 External pressure nozzle
- 15 Flushing channel (outside)
- 16 Cleaning valve (P3 control throttle)
- 17 Differential pressure contact gauge
- 18 P1 gauge

3. Technical data

- 1 Cleaning drive: can be mounted turned 90°
- 2 External pressure valve
- Vent screw G1/4
- Optional: Differential pressure indicator/switch
- 5 Optional: Pressure sensor
- Optional: Sensor Actor Box
- Mounting plate
- Optional: Automatic backflush valve
- Optional: P3 control throttle with P3 gauge
- 10 Name-plate
- Optional: Automatic drain valve
 - Clearance = 400 mm

Filter data

Max. operat. pressure: Max. operat. temperature: 100 °C

Materials:

16 bar

Housing and cover: cast iron Internals: C-steel, PPS GF40

Bearing bushes: PTFE based

Seals: FPM (Viton)

Segmented element: 1.4571/AI

(∆p max. 10 bar)

Cover lock: Connections and nominal diameters: 4 x M16 hexagon screws

A-inlet, B-outlet, C-drain: G11/2 threaded holes DIN 3852 form Z in flange DN 40

D-external pressure: G1 (must be reduced to G1/2 by the costumer)

E-backflush: G1 accord. DIN 3852 form Z

F-gauge: G1/2 accord. DIN 3852 form

G-indicator: G1/8 accord. DIN 3852 form X

Drive shaft seal: Lip seal with O-Ring

External finish: Synthetic resin primer, blue acc. to

RAL 5007

recommended design

Possible cleaning and discharge modes

Fully automatic operation:

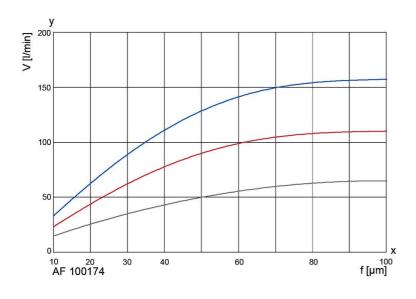

Filtration usually takes place under pressure. The filter is cleaned after a programmed time or a preset number of cycles or according to the differential pressure. We recommend cleaning the system at a differential pressure of approx. 0.5 - 0.7 bar. The cleaning motor is operated for around 3 s (about one turn of the element). The external pressure and cleaning valves remain open for this period. This suffices to clean the filter thoroughly.

The drain valve is opened in order to discharge the filter. Depending on the residue concentration, this can either take place directly after cleaning or be time or cycle controlled. The opening time of the drain valve is 2 bis 3 s.

Refer to the Instruction Manual for further information.

Filtration Group's team of specialists will be pleased to assist in any way. Tests can be carried out in the absence of reliable evaluation criteria.

5. Performance curves

The curves indicate the volume flow through the complete filter system (filter housingh including element) and are referred to a differential pressure of 0.3 bar. Specific process information is essential to guarantee reliable operation of an auto-

matic filter.
