Automatic metal-edge filter AF 74 S/AF 94 S

with radial scraper cleaning housing in welded design, optionally with cyclone effect Connection size DN 80, DN 100, DN 125, DN 150 others upon request

1. Features

For the filtration and homogenization of low and high-viscosity fluids and pastes, Filtration Group automatic metal-edge filters offer an extensive range of applications.

The compact inline filter systems can be equipped with automatic cleaning. The system is cleaned by rotating the cartridge against a spring actuated scraper. The AF 94 S version is with integrated preseparator.

Advantages:

- Low life cycle costs because of no filter material consumtion
- Cleaning can be performed without an interruption in filtration
- Precision separation using the surface filter principle
- Sturdy filter cartridge made of triangular stainless steel wire on a robust inner core
- Efficient filter cleaning for process stability
- Solid construction and high-quality materials for a long service life
- Modular Filtration Group Vario system for optimal filter selection
- Material variants for a wide range of possible applications
- Service-friendly
- Worldwide distribution

Optional:

- Design acc. PED 2014 / 68 EU AD 2000; ASME VIII div. U-Stamp; EN 13445; GOST
- Designed on customers demand e.g. heating jacket; special materials; housing adaption.

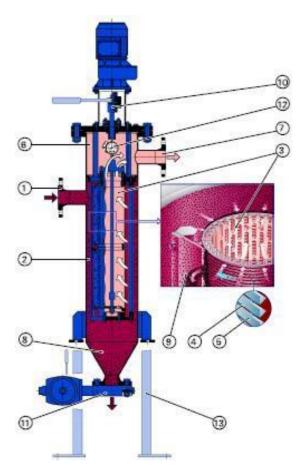

2. Functional principle

The Filtration Group metal-edge filter system is used for filtering and homogenizing an extensive range of liquids and pastes. The compact, inline filter system does not consume any filter material and therefore no disposal is required afterwards.

With the modular Filtration Group Vario system on the Filtration Group metal-edge filters it is possible to configure up to three filter cartridges above one another when high throughput rates are needed.

The filter can be cleaned either automatically or semi-automatically without interrupting operation. The concentrated solids are easily drained by opening the system for a short time.

The medium being cleaned is guided into the filter housing under pressure or in suction mode. It flows inward through the Filtration Group filter cartridges. The solids are separated on the surface of the triangular wires of the filter cartridge.

The filtered fluid exits the filter housing at the top opposite the inlet connection. In the AF 94 S version, the integrated preseparator relieves the filter cartridge of coarse and heavy particles by means of a tangential flow around the tube.

Cleaning of the filter is performed either when a preset differential pressure limit is reached or after a specified cycle time elapses. Here the Filtration Group filter cartridges are rotated against spring actuated scrapers.

The special gap geometry of the filter cartridge ensures efficient cleaning.

The particles or agglomerates are skimmed from the surface and settle in the collection cone. The patented bearing in the filter cartridges (AKF system) prevents high axial forces and simplifies the cleaning procedure.

The residue that settles in the collection cone can be emptied through the drain valve either when the machine is stopped or during filtration

On the Filtration Group metal-edge filter AF 74 S, coiled cartridges, welded cartridges, and perforated foils can be used.

Filtration Group coiled cartridge (standard):

- Optimal cleaning with sharp-edged triangular wire
- Large effective filter surface
- Precise, small gap widths
- High differential pressure stability and torsional strength
- Different material combinations possible

Filtration Group welded cartridge:

- High wear resistance to abrasive media
- Sturdy trapezoidal profile for highviscosity media
- Continuous welded design
- Stainless steel construction

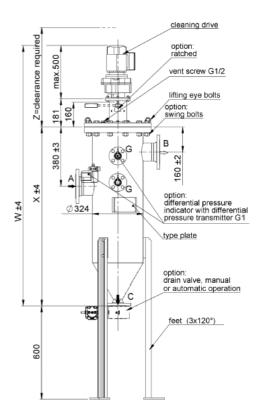

Filtration Group perforated foil:

- Specified sharp-edged hole diameter
- Asymmetric hole pattern
- Continuous welded design
- Manufactured in stainless steel or nickel
- Suitable for filtering fibrous waste material
- 1 Inlet connection
- 2 Inlet plenum
- 3 Filtration Group filter cartridge
- 4 Triangular wire winding
- 5 Triangular wire
- 6 Plenum for filtered fluid
- 7 Outlet connection
- 8 Particle collection cone
- 9 Scraper
- 10 Cleaning drive with gear motor or hand ratchet
- 11 Drain valve (automatic or manual)
- 12 Differential pressure indicator/switch / manometer Differential pressure gange with transmitter
- 13 Feet

recommended design

Cleaning and emptying

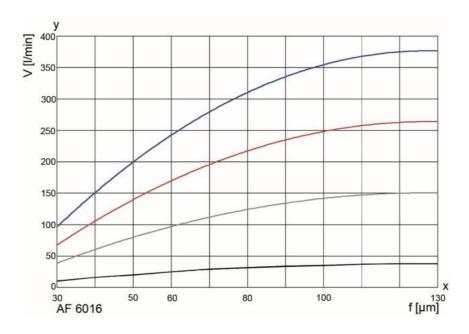

Fully automatic operation:

Filtration usually occurs under pressure. The filter is cleaned after a programmed time or a preset number of cycles or according to the differential pressure. We recommend cleaning the system at approximately 4 times the initial differential pressure. The cleaning motor runs for about 10 seconds (about three turns of the filter cartridge). This is sufficient for a thorough cleaning. In certain rare cases it may be necessary to run the motor continuously. The drive shaft is always turned clockwise. The filter is emptied by opening the drain valve. This can either take place synchronously with cleaning or be time or cycle controlled, depending on the residue concentration. The opening time of the drain valve can be set between 2 and 6 seconds. The filter can be emptied in suction mode using a buffer or by interrupting the filtration process.

Semi-automatic and manual operation are also possible.

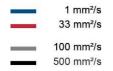

See the Instruction Manual for further information.

The curves represent the volumetric flow through the entire filter system (filter housing including for example one cartridge) and refer to a differential pressure of 0.3 bar. Specific information about process data is essential for reliable operation of an automatic filter.

Important note on performance curve! It's an example of element AF 6016. The number of dements per filter results from type number key in point 6.

Viscosity in mm²/s

y = volumetric flow V [l/min] x = gap width f [μm]
